

Use Caution: Volumes in Blocks 1, 2, 3, 4, 5, and 6 were determined by 10-factor prism cruise plot sampling methods. 129 plots were completed on 170.6 acres in these blocks. This technique is sometimes used to make quick estimates of lower valued timber. The timber cruises involved the measurement of only 1,198 of the estimated 22,597 trees. This small fraction of trees was carefully sampled and is believed to be representative of the entire sale population. Each tree was not measured in these blocks though. Individual block volumes and some species volumes may be highly variable particularly when the sampling size was small or the variability within the stand was high. Total sale volume should be reasonably accurate. Blocks 1-4 were combined into one cruise and blocks 5 and 6 were a second cruise. Average cruise volumes were prorated across the blocks in each cruise based on block acreages. More information, including the original tallies, is available for further evaluation from the forest district office. The tables below may be an aid to making your estimates of volumes and values, but it is particularly important that you use caution on this sale given the nature of variable plot sampling. As stated in the prospectus, bid upon your own estimates. The sawtimber on Block 7 was 100% tallied and every sawtimber tree was measured. Block 7 sawtimber will not have the potential range of errors that are associated with statistical sampling in the other blocks.

Table 1
